$$y = \tan\left(-2x + \frac{\pi}{2}\right)$$

$$x=0 \Rightarrow y = \tan \frac{\pi}{2} = 1$$

$$\rightarrow B(0, 1)$$

$$T = \frac{2\pi}{|2|} = \pi$$

$$A: -2x + \frac{\pi}{2} = -\frac{\pi}{4} \rightarrow A\left(-\frac{\pi}{4}, 0\right)$$

$$C: -2x + \frac{\pi}{2} = \frac{\pi}{4} \rightarrow C\left(\frac{\pi}{4}, 0\right)$$

$$S_{\triangle ABC} = \frac{\pi}{4} \times 1 \times \frac{1}{2} = \frac{\pi}{8}$$

$$x_C - x_A = \frac{\pi}{4}$$

$$x = \frac{r}{\mu} \rightarrow \frac{r}{q} - \frac{r}{\mu} \sin \alpha - \frac{1}{\epsilon} (1 - \sin^2 \alpha) = 0$$

$$\rightarrow \frac{1}{\epsilon} \sin^2 \alpha - \frac{r}{\mu} \sin \alpha + \frac{1}{r^2} - \frac{q}{r^2} = 0 \xrightarrow{\times r^2} q \sin^2 \alpha - r \epsilon \sin \alpha + 1 - q = 0$$

$$\xrightarrow{\text{شماره}} \sin^2 \alpha - r \epsilon \sin \alpha + 2r = (\sin \alpha - r)(\sin \alpha - 2) = 0$$

$$\text{و چون } \frac{r}{\mu} = \frac{r}{q}$$

$$\frac{r}{q} = \frac{1}{\epsilon}$$

$$\rightarrow \sin \alpha = \frac{1}{r}$$

$$\tan \alpha = \frac{1}{r\sqrt{r}}$$

$$\Rightarrow 1 + \tan^2 \alpha = 1 + \frac{1}{r^2} = \frac{q}{r}$$

$$\lg \sin \alpha - \lg(-\cos \alpha) = \lg \frac{\sin \alpha}{-\cos \alpha} = \lg r$$

$$\rightarrow \frac{\sin \alpha}{-\cos \alpha} = -r = \tan \alpha$$

با توجه به اینکه در تعریف داریم $\lg^a$ با α و β باشد

و صورت سوال $\frac{1}{\cos \alpha} = r$ و $\sin \alpha = \frac{r}{\sqrt{1+r^2}}$ و $\cos \alpha = \frac{1}{\sqrt{1+r^2}}$

$$\sin \alpha = \frac{r}{\sqrt{1+r^2}}$$

$$\cos \alpha = \frac{1}{\sqrt{1+r^2}}$$

$$\sin \alpha - \cos \alpha = \frac{r}{\sqrt{1+r^2}} - \frac{1}{\sqrt{1+r^2}} = \frac{r-1}{\sqrt{1+r^2}} = \sqrt{r}$$

$$\sin^2 \theta + \cos^2 \theta = \sin^2 \theta - \sin^2 \theta + 1 = \frac{r}{a} \rightarrow \sin^2 \theta - \sin^2 \theta + \frac{1}{a} = 0$$

$$\rightarrow \sin^2 \theta (\sin^2 \theta - 1) = -\frac{1}{a} = \sin^2 \theta (-\cos^2 \theta) \Rightarrow \sin^2 \theta \times \cos^2 \theta = \frac{1}{a}$$

$$\cos^2 \theta + \sin^2 \theta = \cos^2 \theta - \cos^2 \theta + 1 = \cos^2 \theta (\cos^2 \theta - 1) + 1 = -\sin^2 \theta \cos^2 \theta + 1$$

$$= -\frac{1}{a} + 1 = \frac{r}{a}$$

$$\frac{\sin x (r + \cos x)}{r(1 - \cos^2 x)} = \frac{\sin x (r + \cos x)}{r(\sin^2 x)} = \frac{r + \cos x}{r \sin x} \xrightarrow{+} \sin x < 0 \quad \text{وال ۱}$$

$$-1 < \cos x < 1 \Rightarrow r(r + \cos x) < r^2$$

$$\frac{\sin^2 x}{\cos x} - \frac{1}{\cos x} = \frac{\sin^2 x - 1}{\cos x} = \frac{-\cos^2 x}{\cos x} = -\cos x$$

$$\text{وال ۲} \rightarrow \text{تایید می شود}$$

$$\frac{r}{\sin n} + \frac{\mu}{\cos n} \rightarrow \frac{r}{\sin n} = \frac{-\mu}{\cos n} \rightarrow \frac{r}{-\mu} = \frac{\sin n}{\cos n} = \tan n$$

سوال 4

$$\rightarrow \cot n = -\frac{\mu}{r} \quad \tan n + \cot n = -\frac{r}{\mu} + \left(-\frac{\mu}{r}\right) = \frac{-r - \mu}{r} = -\frac{r + \mu}{r}$$

$$\frac{\sqrt{1 + \sin \omega}}{\sin \omega + \sin 1} = ? \quad \sqrt{1 + \sin \omega} = \sqrt{1 + \cos \epsilon} = \sqrt{2 \cos^2 \frac{\epsilon}{2}} = \sqrt{2} \cos \frac{\epsilon}{2}$$

سوال 5

$$\sin(\omega) + \sin(1) = \sin(r + r) + \sin(r - r) = \sin r \cos r + \sin r \cos r + \sin r \cos r - \sin r \cos r$$

$$= 2 \sin r \cos r$$

$$\Rightarrow \frac{\sqrt{2} \cos \frac{\epsilon}{2}}{2 \sin r \cos r} = \frac{\sqrt{2}}{2 \times \frac{1}{r}} = \sqrt{2} r$$

$$\underbrace{(1 - r \sin^2 \omega)}_{\cos 1} \underbrace{(r \cos^2 1 - 1)}_{\cos r} \underbrace{\left(\frac{1 - \tan^2 r}{1 + \tan^2 r}\right)}_{\cos \epsilon} \times \frac{\sin 1}{\sin 1} = \frac{\frac{1}{r} \sin r}{\sin 1 \cos 1 \cos r \cos \epsilon}$$

سوال 1

$$\Rightarrow \frac{\frac{1}{\Lambda} \sin \Lambda}{\sin 1} = \frac{\frac{1}{\Lambda} \cos 1}{\sin 1} = \frac{1}{\Lambda} \cot 1$$

Date:

Sub:

$$\omega \cos \alpha - 12 \cos \alpha = \omega (12 \cos \alpha - 1) - 12 \cos \alpha = 12 \cos \alpha - 12 \cos \alpha - \omega \quad \text{9 وال}$$

$$\sin \alpha + 12 \cos \alpha = 1 \rightarrow \sin \alpha = 1 - 12 \cos \alpha \xrightarrow{\text{مربع}} \sin^2 \alpha = 1 + 9 \cos^2 \alpha - 24 \cos \alpha = 1 - \cos^2 \alpha$$

$$\rightarrow 10 \cos^2 \alpha - 12 \cos \alpha = -12 \quad \text{نضرب في 10} \quad 10 \cos^2 \alpha - 12 \cos \alpha - \omega = -12 - \omega = -1$$

$$\cos^2 A / r = \frac{1 + \cos A}{r} = \sin B \sin C \rightarrow 1 + \cos A = r \sin B \sin C \quad \text{10 وال}$$

$$\cos A = \cos (\pi - (B + C)) = -\cos (B + C)$$

$$\rightarrow r \sin B \sin C = 1 - \cos (B + C) = 1 - \cos B \cos C + \sin B \sin C$$

$$\rightarrow \sin B \sin C + \cos B \cos C = 1 = \cos (B - C) \rightarrow B - C = 0 \rightarrow B = C = 17$$

$$A + B + C = 180^\circ \rightarrow A = 180 - 2 \times 17 = 146^\circ$$
